EM359: WEBINAR - "Parkinson's disease: clinical and rehabilitation framework"

CAROLA COSENTINO

Parkinson's disease is a neurodegenerative extrapyramidal syndrome, as well as the most frequent movement disorder. In recent years there has been a constant increase in incidence and the onset is increasingly earlier.

The expression of this pathology, deriving from the interaction between motor and non-motor symptoms, can be extremely variable and make patient management very complex.

To be able, therefore, to orient oneself in the tangle of symptoms that can manifest, it is necessary for the clinician to be aware of all the nuances that can characterize the patient's symptomatic picture and on which the setting of the therapeutic program depends.

This webinar will provide an evidence-based overview of Parkinson's disease, with the aim of providing clinicians with a handbook of the main factors, not just motor, that need to be taken into consideration when taking care of the patient's rehabilitation.
